### Question: 12.13.2.18

#### Problem Statement:

Two events A and B will be independent, if

- (A) A and B are mutually exclusive
- (B)  $\Pr(A'B') = [1 - \Pr(A)][1 - \Pr(B)]$
- (C)  $\Pr(A) = \Pr(B)$
- (D)  $\Pr(A) + \Pr(B) = 1$

**Answer:** Option (B)

#### Solution:

(B)  $\Pr(A'B') = [1 - \Pr(A)][1 - \Pr(B)]$

$$\Pr(A'B') = [1 - \Pr(A)][1 - \Pr(B)] \quad (1)$$

$$\implies \Pr(A'B') = 1 - \Pr(A) - \Pr(B) + \Pr(A)\Pr(B) \quad (2)$$

$$\implies 1 - \Pr(A + B) = 1 - \Pr(A) - \Pr(B) + \Pr(A)\Pr(B) \quad (3)$$

$$\implies -[\Pr(A) + \Pr(B) - \Pr(AB)] = -\Pr(A) - \Pr(B) + \Pr(A)\Pr(B) \quad (4)$$

$$\implies -\Pr(A) - \Pr(B) + \Pr(AB) = -\Pr(A) - \Pr(B) + \Pr(A)\Pr(B) \quad (5)$$

$$\implies \Pr(AB) = \Pr(A) \cdot \Pr(B) \quad (6)$$

$$(7)$$

Hence it shows A and B are Independent events

(A) When tossing a coin, the event of getting a head and tail are mutually exclusive and let them be denoted by A and B respectively.

$$\Pr(A) = \Pr(B) = \frac{1}{2} \quad (8)$$

$$\implies \Pr(A) \times \Pr(B) = \frac{1}{4} \quad (9)$$

$$\Pr(AB) = 0 \neq \Pr(A) \times \Pr(B) \quad (10)$$

Hence A and B are not independent.

(C) For the same counter example given for option A,  $\Pr(A) = \Pr(B)$ , But A and B are not independent events.

(D) For the same counter example given for option A,  $\Pr(A) + \Pr(B) = 1$ , But A and B are not independent events.
